

# vector CAD/CAM

## Review

### polymehr GmbH

Acrylic glass sets design highlights and is an interesting alternative to many conventional materials.

We as polymehr GmbH work not only at everyday plastic projects, but also at unusual creations such as the installation of acoustic reflectors made of Plexiglas in the new stage of the Bavarian State Opera or light sculptures in the Cocoon Club in Frankfurt, currently the most trendy club in Germany.

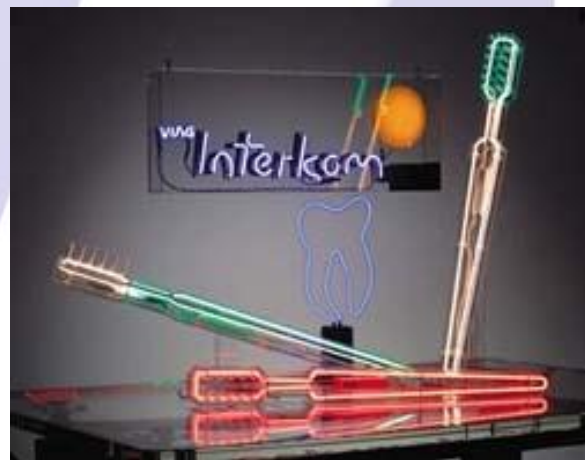

Of course also the production of signs, machine protective covers, displays, and illuminated advertising-installations is part of daily business.

Besides Acrylic glass also many other plastics are processed, for example such as Makrolon or Corian.

Besides manual skills and years of experience of the employees, the latest technology, high-quality tools and machines are essential to realize these projects. In the technical field of software we have therefore decided for the CAD / CAM program Vector. The decisive factor to the application of Vector was the ease of use, the excellent value for money, and easy connection and adjustment to our CNC machines.

In addition we could solve all tasks quickly and easily since the launch of vector - both in 2D and in 3D.

Very commendable we found the training and support during the introductory phase of the program by the company Centriforce. Questions that occur sporadically a year after the introduction answered the hotline of the company Centriforce quickly and competently. For these reasons, we would take the decision for the program always again.
